5. Composite Second Order (CSO) - The CSO parameter (both sum and difference products) is defined by ANSI/SCTE 6. Composite Triple Beat (CTB) - The CTB parameter is defined by ANSI/SCTE 6. Cross Modulation (XMOD) - Cross modulation (XMOD) is measured at baseband (selective voltmeter method), referenced to 100% modulation of the carrier being tested. Carrier to Intermodulation Noise (CIN) - The CIN parameter is defined by ANSI/SCTE 17 (Test procedure for carrier to noise).

RFCM3327 Current Adjustment

The RFCM3327 can be operated over a wide range of current to provide maximum required performance with minimum current consumption. Changing the value of resistor R3 on application circuit allows a variation of the current between 470 mA and 350 mA (typ.). Within the recommended range of current between 470 mA and 370 mA gain (S21) change is less than 0.2 dB (typ.) and noise figure change is less than 0.2 dB (typ.).

Device Current versus Resistor R3 (typical values)

Device Current [mA], typical	R3 [Ω]
470	1500
430	1350
390	1200
350	1050

Test conditions: $V_{+}=24$ V, $T_{MB}=30$ °C, $Z_S=Z_L=75$ Ω

Device Current versus Distortion Degradation (typical values)

Test condition: $V_{+}=24$ V, $T_{MB}=30$ °C, $Z_S=Z_L=75$ Ω; $V_O = 61$ dBmV at 1218 MHz, 22 dB extrapolated tilt, 79 analog channels plus 111 digital channels (-6 dB offset)

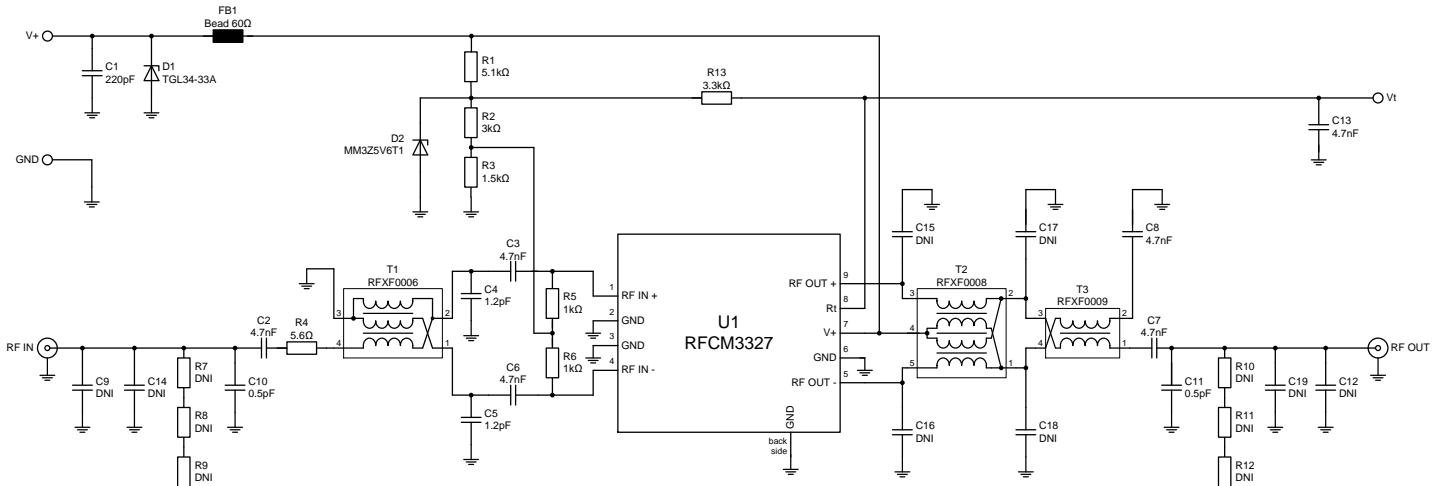

RFCM3327 Temperature Sensing Feature

The RFCM3327 provides an internal NTC resistor for temperature sensing. This resistor is located right next to the output transistor stage. Within the application circuit the NTC is part of a voltage divider. The output voltage of the voltage divider (V_t) can be correlated to the module backside temperature.

Evaluation Board Schematic

Evaluation Board Assembly Drawing

Note: Vias are required under the backside paddle of this device for proper RF/DC grounding and thermal dissipation. A via drill diameter of 0.4mm and a minimum via wall copper plating thickness of 25um is recommended. Open vias are preferred to allow flux and gases to escape during reflow soldering and therefore to minimize voiding. Underneath this via array a heat sink with thermal grease needs to be placed which is able to dissipate the complete module DC power (up to 11.3 Watts). In any case the module backside temperature should not exceed 110 °C.
